Form Approved
OMB No. 0704-0188

Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing this collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

PL(OLAC)/RKAS Concentrator Information

February 11, 1993

This package contains information on the PL(OLAC)/RKAS solar concentrator for those who need to do modeling or other calculations. It contains the original design drawings, a map showing damaged concentrator facets, modeled solar flux, and a list of the approximate facet center positions. Measured flux data will be added to this package after we can realign our concentrator facets. We will also try to keep this information up to date as changes are made. Use this data at your own risk. We are willing to assist so please call, write, or email if you need anything.

The concentrator design drawings are accurate to the best of our knowledge. We used dimensions from the drawings to calculate the facet center positions for our own models (using some approximations). These approximate facet center positions are listed separately or you can get these electronically if you prefer. They are listed in (x, y, z) format. The coordinate system is right-handed with the x axis pointing up, the y axis pointing horizontally, and the z axis pointing towards the focal point. The origin is at the concentrator vertex. We have found that the calculated facet z components are within a centimeter. The x and y components could be off by several centimeters in the azimuthal direction. The magnitude of the x and y components, $\sqrt{x^2 + y^2}$, is believed to be accurate to within a few millimeters.

The facets have two different values depending on which ring they are in (ring 1 is the closest to the concentrator center and ring 8 is the outermost). Facets in rings 1 through 5 have a focal length of 4.33 ± 0.03 meters. Facets in rings 6 through 8 have a focal length of 4.61 ± 0.03 meters. A number of facets are broken or missing. The cracks have been overlayed on a concentrator facet drawing (note the facets are not quite the proper shape in this drawing). Some of the cracks cause only slight problems. Others give slope errors on the order of 5 milliradians. Other facets are completely missing (filled in on drawing), or covered (by a water based paint) because of the severity of the cracks. Also note that the gap that separates neighboring facet reflecting surfaces is approximately one half of a centimeter.

We ran our concentrator model and plotted results for the target-plane placed at three different positions: 4.05, 4.10, and 4.15 meters from the concentrator vertex. The model assumed the concentrator focal point to be at 4.15 meters from the concentrator vertex. This package contains a contour plot and a surface plot for each position. These plots use the same scale; The plot boundaries extend from -10 cm to +10 cm from the target center in both target dimensions. The surface plot intensity scale is the same for all surface plots. The label of each plot reveals the assumed total slope error, 1.5 milliradians, the focal point of the concentrator, 4.15 meters, and the target position. The heliostat is assumed to reflect 90% of the incident light and the concentrator is assumed to reflect 94%

of the light from heliostat. The incident solar flux at the heliostat is assumed to be 1000 watts/meter². These values assume optimal weather conditions, and well cleaned optical surfaces. The contour plot for the target at 4.15 meters shows that 10,350 suns (14,000,000 watts/meter²) can be achieved at the center of the target under these conditions.

ENGINEERING LAYOUT C

Technical drawing of a mechanical part, likely a cross-section of a shaft or pipe. The drawing shows a rectangular profile with a hatched top section. Key dimensions and labels include:

- A horizontal dimension of 16.50 across the middle section.
- A vertical dimension of 2.00 on the right side, indicating the thickness of the hatched section.
- A label D with a horizontal arrow pointing to the right, indicating a diameter or width.
- A label E with a vertical arrow pointing upwards, indicating a height or distance.
- A circled number 10 located near the bottom center, possibly indicating a material grade or a specific feature.

1.2

1. POSITION SOLAR COLLECTOR PERPENDICULAR TO PRO AND LEVEL BY CHOUFING.
2. INSTALL SOLAR COLLECTOR MOUNT ASSEY ON PERPEND.
3. INSTALL SOLAR COLLECTOR AND ALIGN WITH AERIOSTAT. TIGHTEN BOLTS AND WELD AS INDICATED.
4. ASSEMBLE BRACE
